Part 1 Trading Goods and Answer Sheets

1 Mini-bagged pistachio, almond, and cashew nut for Exp. 1

A mini bag of pistachio

A mini bag of almond

A mini bag of cashew nut

2 Apple, pen, and facial tissue for Exp. 2

3 Answer sheets for Exp. 1

3.1 Answer sheet in Session A of Exp. 1

Name _____		Sex _____	Birth: month ___ year _____	
<i>Item</i>	<i>Price</i>	<i>Quantity</i>	<i>Money</i>	
Choice I:				
Pistachio	¥0.50 /bag	_____	_____	
Almond	¥0.50 /bag	_____	_____	
Cashew nut	¥0.50 /bag	_____	_____	
Total money amount:			_____ (No more than ¥6.60)	
Choice II:				
Pistachio	¥0.70 /bag	_____	_____	
Almond	¥0.30 /bag	_____	_____	
Cashew nut	¥0.50 /bag	_____	_____	
Total money amount:			_____ (No more than ¥6.60)	
Choice III:				
Pistachio	¥0.50 /bag	_____	_____	
Almond	¥0.30 /bag	_____	_____	
Cashew nut	¥0.70 /bag	_____	_____	
Total money amount:			_____ (No more than ¥6.60)	

3.2 Inquiry card in Session B of Exp. 1

The following is an example of the inquiry card used in Session B of Exp. 1.

Cashew nut: 8 bags
Unit price: ¥0.50/bag
Your bid unit price: (¥)

4 Answer sheets for Exp. 2

4.1 Answer sheet in Session A of Exp. 2

Name _____ Sex _____ Birth: month ___ year _____			
<i>Item</i>	<i>Price</i>	<i>Quantity</i>	<i>Money</i>
Choice I:			
Apple	¥0.50 /piece	_____	_____
Pen	¥0.50 /piece	_____	_____
Facial tissue	¥0.50 /set	_____	_____
Total money amount:			_____ (No more than ¥8.00)
Choice II:			
Apple	¥0.70 /piece	_____	_____
Pen	¥0.90 /piece	_____	_____
Facial tissue	¥0.50 /set	_____	_____
Total money amount:			_____ (No more than ¥8.00)
Choice III:			
Apple	¥0.50 /piece	_____	_____
Pen	¥0.90 /piece	_____	_____
Facial tissue	¥0.70 /set	_____	_____
Total money amount:			_____ (No more than ¥8.00)

4.2 Inquiry card in Session B of Exp. 2

The following is an example of the inquiry card used in Session B of Exp. 2.

Apple: 8 pieces

Unit price: ¥0.50/piece

Your bid unit price: (¥)

Part 2 Estimating U_{LES} in Exp. 1 of C-Sample

1 Original data

Tables 2-1, 2-2, and 2-3 present the original data obtained from Session A in Exp. 1 of C-Sample for solving LES.

Table 2-1 Data of Choice I of Exp. 1 of C-Sample

2 Derivation for U_{LES}

Denoting b_{ij} and r_{ij} the estimated values in experimental data, and e_{ij} the residue, the estimated LES in Exp.1 is

$$p_{ij}q_{ij} = p_{ij}r_{ij} + b_{ij} \left(\sum_{j=1}^3 p_{ij}q_{ij} - \sum_{j=1}^3 p_{ij}r_{ij} \right) + e_{ij}, \quad i=I,II,III, \quad j=1,2,3.$$

Approximately,

$$p_{ij}q_{ij} \approx p_{ij}r_{ij} + b_{ij} \left(\sum_{j=1}^3 p_{ij}q_{ij} - \sum_{j=1}^3 p_{ij}r_{ij} \right), \quad i=I,II,III, \quad j=1,2,3.$$

Denoting

$$a_{ij} = p_{ij}r_{ij} - b_{ij} \sum_{j=1}^3 p_{ij}r_{ij}, \quad (2-1)$$

a_{ij} is a constant. The LES becomes

$$p_{ij}q_{ij} \approx a_{ij} + b_{ij} \sum_{j=1}^3 p_{ij}q_{ij}, \quad i=I,II,III, \quad j=1,2,3. \quad (2-2)$$

Sum on the both sides in (2-1)

$$\sum_{j=1}^3 a_{ij} \approx \sum_{j=1}^3 p_{ij}r_{ij} - \sum_{j=1}^3 b_{ij} \sum_{j=1}^3 p_{ij}r_{ij} = \sum_{j=1}^3 p_{ij}r_{ij} \left(1 - \sum_{i=1}^3 b_{ij} \right)$$

Transpose the terms

$$\sum_{j=1}^3 p_{ij}r_{ij} \approx \frac{\sum_{j=1}^3 a_{ij}}{1 - \sum_{j=1}^3 b_{ij}}. \quad (2-3)$$

Substitute (2-3) in (2-1)

$$p_{ij}r_{ij} \approx a_{ij} + b_{ij} \frac{\sum_{j=1}^3 a_{ij}}{1 - \sum_{j=1}^3 b_{ij}}, \quad .i=I,II,III, \quad j=1,2,3. \quad (2-4)$$

Utilizing the ordinary least square method (OLS) to solve (2-2) in the data of Tables 2-1-I, 2-2-II, and 2-3-III, the estimated values of a_{ij} and b_{ij} will be obtained. Then, substituting these estimated values in (2-4) and solving for r_{ij} , the estimated values of r_{ij} will be derived out. And using b_{ij} and r_{ij} U_{LES} will be determined. This is one of standard estimation approaches to solve LES in observed data.

The above approximate approach relies on the residue $e_{ij} \neq 0$. In case of $e_{ij} = 0$, from the definition of b_{ij} , $1 - \sum_{j=1}^3 b_{ij} = 0$ will exactly hold, and it will lead the fraction on the right-hand side of (2-4) diverge, namely, the estimation will become impossible. Such a case indeed occurs in Choice I of Exp. 2 (see Part 5).

Solving (2-2) in the data of Table 2-1-I for Choice I,

$$\begin{cases} a_{I1}=0.096, \\ b_{I1}=0.306; \end{cases} \begin{cases} a_{I2}=-0.205, \\ b_{I2}=0.330; \end{cases} \begin{cases} a_{I3}=0.118, \\ b_{I3}=0.362. \end{cases}$$

Solving (2-2) in the data of Table 2-2-II for Choice II,

$$\begin{cases} a_{II1}=-0.279, \\ b_{II1}=0.316; \end{cases} \begin{cases} a_{II2}=-0.287, \\ b_{II2}=0.407; \end{cases} \begin{cases} a_{II3}=0.569, \\ b_{II3}=0.276. \end{cases}$$

Solving (2-2) in the data of Table 2-3-III for Choice III,

$$\begin{cases} a_{III1}=0.264, \\ b_{III1}=0.323; \end{cases} \begin{cases} a_{III2}=0.045, \\ b_{III2}=0.330; \end{cases} \begin{cases} a_{III3}=-0.307, \\ b_{III3}=0.346. \end{cases}$$

Substituting the above results of a_{ij} and b_{ij} in (2-4) and solving for r_{ij} , obtain

$$\begin{aligned} r_{I1}=2.95, \quad r_{I2}=2.56, \quad r_{I3}=3.49; \\ r_{II1}=0.96, \quad r_{II2}=3.11, \quad r_{II3}=2.79. \\ r_{III1}=1.82, \quad r_{III2}=2.35, \quad r_{III3}=0.55. \end{aligned}$$

Finally obtain each U_{LES} in Session A of Exp. 1 for C-Sample:

in Choice I,

$$U_{LES} = 0.31 \ln(q_{I1} - 2.95) + 0.33 \ln(q_{I2} - 2.56) + 0.36 \ln(q_{I3} - 3.49); \quad (2-1)$$

in Choice II,

$$U_{LES} = 0.32 \ln(q_{II1} - 0.96) + 0.41 \ln(q_{II2} - 3.11) + 0.28 \ln(q_{II3} - 2.79); \quad (2-2)$$

in Choice III,

$$U_{LES} = 0.32 \ln(q_{III1} - 1.82) + 0.33 \ln(q_{III2} - 2.35) + 0.35 \ln(q_{III3} - 0.55); \quad (2-3)$$

Part 3 Estimating U_{Est} in Exp. 1 of C-Sample

1 Original data

Tables 3-1, 3-2, 3-3, 3-4, 3-5, and 3-6 present the experimental data obtained from Session B in Exp. 1 of S-Sample. The data created by multiplying subjects' bid unit prices with corresponding assigned quantities. For example, in Table 3-1, the up-left datum "1.60" is created by multiplying subject S_1 's bid unit price 0.40 with corresponding assigned quantity "4", that is, $0.40 \times 4 = 1.60$. Or reversely, this datum "1.60" means S_1 's bid unit price for assigned quantity "4" is 0.40; similarly, on the first line of the data block in Table 3-1, the second datum "1.80" means S_1 's bid unit price for assigned quantity "6" is 0.30, and so on.

Table 3-1 Data for the utility scales of pistachio in Choices I and III (u_I, u_{III})

2 Derivation for U_{Est}

2.1 Estimating r_{ij}

The estimated values of r_{ij} are contained in the utility curve estimations in the data of Session B. The key problem in derivation for U_{Est} is how to estimate r_{ij} by determining the utility curves.

To estimate r_{ij} , fit the logarithmic law $u_{ij}=c\ln(q_{ij}-r_{ij})+C$, $i=I,II,III$ and $j=1,2,3$, in the average data of Session B (they are listed on the bottom lines of Tables 3-1, 3-2, 3-3, 3-4, 3-5, and 3-6). It is realized by the curve regression in SPSS, in which the optimal values of c and C in the logarithmic law are created automatically, but r_{ij} must be selected by hand. To isolate from the derivation of U_{LES} , the procedure for selecting r_{ij} is that select the values of r_{ij} to improve the regression results in SPSS until $R^2 \geq 0.97$.

1) Estimating r_{I1} , r_{I2} , and r_{I3} in Choice I

For Choice I, by fitting the logarithmic law in the average data presented on the bottom lines in Tables 3-1, 3-2, and 3-3, the curve regression results in SPSS are as the following:

For the pistachio, the logarithmic law is

$$u_{I1}=1.06\ln(q_{I1}-2.39)+0.89, \quad r_{I1}=2.39 \quad (R^2=0.985).$$

Model Summary and Parameter Estimates

Dependent Variable: uI1

Equation	Model Summary					Parameter Estimates	
	R Square	F	df1	df2	Sig.	Constant	b1
Logarithmic	.985	203.640	1	3	.001	.893	1.055

The independent variable is qI1.

For the almond, the logarithmic law is

$$u_{12}=1.111\ln(q_{12}-2.30)+0.71, \quad r_{12}=2.30 \quad (R^2=0.970).$$

Model Summary and Parameter Estimates

Dependent Variable:VAR00003

Equation	Model Summary					Parameter Estimates	
	R Square	F	df1	df2	Sig.	Constant	b1
Logarithmic	.970	95.810	1	3	.002	.713	1.107

The independent variable is VAR00004.

For the cashew nut, the logarithmic law is

$$u_{13}=1.07\ln(q_{13}-2.50)+0.90, \quad r_{13}=2.50 \quad (R^2\approx 0.970).$$

In this curve estimation for cashew nut, the value of R^2 is rounded from 0.965 to 0.97, because the value of R^2 is very insensitive to the value of r_{13} in this point. It is caused by such a situation: among five fitted data, four of them have fitted to the logarithmic curve very well, but the second datum still deviates from the curve by a relatively big distance. The overall effect of the regression is very well with $R^2=0.965$.

Model Summary and Parameter Estimates

Dependent Variable:u13

Equation	Model Summary					Parameter Estimates	
	R Square	F	df1	df2	Sig.	Constant	b1
Logarithmic	.965	81.508	1	3	.003	.898	1.067

The independent variable is q13.

Summing up, in Choice I of C-Sample, the estimated values of r_{ij} for U_{Est} are $r_{I1}=2.39$, $r_{I2}=2.30$, $r_{I3}=2.50$.

2) Estimating r_{II1} , r_{II2} , and r_{II3} in Choice II

For Choice II, $r_{II3}=r_{I3}=2.50$ because their assigned quantities and prices are the same. By fitting the logarithmic law in the average data presented on the bottom lines in Tables 3-4 and 3-5, the curve regression results in SPSS for r_{II1} and r_{II2} are derived as the following:

For the pistachio, the logarithmic law is

$$u_{II1}=1.93\ln(q_{II1}-0.96)-0.29, \quad r_{II1}=0.96 \quad (R^2=0.993).$$

Model Summary and Parameter Estimates

Dependent Variable: uII1

Equation	Model Summary					Parameter Estimates	
	R Square	F	df1	df2	Sig.	Constant	b1
Logarithmic	.993	429.911	1	3	.000	-.292	1.932

The independent variable is qII1.

For the almond, the logarithmic law is

$$u_{II2}=0.74\ln(q_{II2}-2.40)-0.56, \quad r_{II2}=2.40 \quad (R^2=0.970).$$

Model Summary and Parameter Estimates

Dependent Variable: uII2

Equation	Model Summary					Parameter Estimates	
	R Square	F	df1	df2	Sig.	Constant	b1
Logarithmic	.970	97.930	1	3	.002	.555	.743

The independent variable is qII2.

Summing up, in Choice II of C-Sample, the estimated values of r_{IIj} for U_{Est} are $r_{II1}=0.96$, $r_{II2}=2.40$, $r_{II3}=r_{I3}=2.50$.

3) Estimating r_{III1} , r_{III2} , and r_{III3} in Choice III

For Choice III, $r_{III1}=r_{I1}=2.39$ and $r_{III2}=r_{II2}=2.40$ because their assigned quantities and prices are the same respectively. By fitting the logarithmic law in the average data presented on the bottom line in Table 3-6, the curve regression result in SPSS for r_{III3} is derived as the following:

For the cashew nut, the logarithmic law is

$$u_{III3}=2.25\ln(q_{III3}-0.55)-1.02, \quad r_{III3}=0.55 \quad (R^2=0.985).$$

Model Summary and Parameter Estimates

Dependent Variable: uIII3

Equation	Model Summary					Parameter Estimates	
	R Square	F	df1	df2	Sig.	Constant	b1
Logarithmic	.985	193.105	1	3	.001	-1.020	2.248

The independent variable is qIII3.

Summing up, in Choice III of C-Sample, the estimated values of r_{IIIj} for U_{Est} are $r_{III1}=r_{I1}=2.39$, $r_{III2}=r_{I2}=2.40$, $r_{III3}=0.55$.

Now the estimated values of r_{ij} for each U_{Est} in Choices I, II, and III of C-Sample all have been obtained. They are collected below:

in Choice I: $r_{I1}=2.39$, $r_{I2}=2.30$, $r_{I3}=2.50$;

in Choice II: $r_{II1}=0.96$, $r_{II2}=2.40$, $r_{II3}=r_{I3}=2.50$;

in Choice III: $r_{III1}=r_{I1}=2.39$, $r_{III2}=r_{I2}=2.40$, $r_{III3}=0.55$.

2.2 Estimating b_{ij}

b_{ij} follows the formula $b_{ij} = \frac{p_{ij}(q_{ij} - r_{ij})}{\sum p_{ij}(q_{ij} - r_{ij})}$, $i=I,II,III$ and $j=1,2,3$. In the experiments, for U_{Est} ,

the formula is rewritten

$$b_{ij} = \frac{p_{ij}(\bar{q}_{ij} - r_{ij})}{\sum p_{ij}(\bar{q}_{ij} - r_{ij})}, \quad i=I,II,III \text{ and } j=1,2,3.$$

Where, \bar{q}_{ij} is estimated by the data presented on the bottom lines in Tables 2-1, 2-2, and 2-3 in Part 2,

and r_{ij} had been obtained above.

Using the data on the bottom line of Table 2-1 and the estimated values of r_{ij} , b_{ij} for U_{Est} in Exp. 1 of C-Sample is estimated for Choice I:

$$b_{I1} = \frac{p_{I1}(\bar{q}_{I1} - r_{I1})}{\sum p_{Ij}(\bar{q}_{Ij} - r_{Ij})} = \frac{0.5(4.0 - 2.39)}{0.5(4.0 - 2.39) + 0.5(3.95 - 2.30) + 0.5(4.18 - 2.50)} = 0.32 ;$$

$$b_{I2} = \frac{p_{I2}(\bar{q}_{I2} - r_{I2})}{\sum p_{Ij}(\bar{q}_{Ij} - r_{Ij})} = \frac{0.5(3.95 - 2.30)}{0.5(4.0 - 2.39) + 0.5(3.95 - 2.30) + 0.5(4.18 - 2.50)} = 0.33 ;$$

$$b_{I3} = \frac{p_{I3}(\bar{q}_{I3} - r_{I3})}{\sum p_{Ij}(\bar{q}_{Ij} - r_{Ij})} = \frac{0.5(4.18 - 2.50)}{0.5(4.0 - 2.39) + 0.5(3.95 - 2.30) + 0.5(4.18 - 2.50)} = 0.34 .$$

Using the data on the bottom line of Table 2-2 and the estimated values of r_{IIj} , b_{IIj} for U_{Est} in Exp. 1 of C-Sample is estimated for Choice II:

$$b_{II1} = \frac{p_{II1}(\bar{q}_{II1} - r_{II1})}{\sum p_{IIj}(\bar{q}_{IIj} - r_{IIj})} = \frac{0.7(2.54 - 0.96)}{0.7(2.54 - 0.96) + 0.3(7.05 - 2.40) + 0.5(4.24 - 2.50)} = 0.33 ;$$

$$b_{II2} = \frac{p_{II2}(\bar{q}_{II2} - r_{II2})}{\sum p_{IIj}(\bar{q}_{IIj} - r_{IIj})} = \frac{0.3(7.05 - 2.40)}{0.7(2.54 - 0.96) + 0.3(7.05 - 2.40) + 0.5(4.24 - 2.50)} = 0.41 ;$$

$$b_{II3} = \frac{p_{II3}(\bar{q}_{II3} - r_{II3})}{\sum p_{IIj}(\bar{q}_{IIj} - r_{IIj})} = \frac{0.5(4.24 - 2.50)}{0.7(2.54 - 0.96) + 0.3(7.05 - 2.40) + 0.5(4.24 - 2.50)} = 0.26 .$$

Using the data on the bottom line of Table 2-3 and the estimated values of r_{IIIj} , b_{IIIj} for U_{Est} in Exp. 1 of C-Sample is estimated for Choice III

$$b_{III1} = \frac{p_{III1}(\bar{q}_{III1} - r_{III1})}{\sum p_{IIIj}(\bar{q}_{IIIj} - r_{IIIj})} = \frac{0.5(4.35 - 2.39)}{0.5(4.35 - 2.39) + 0.3(7.28 - 2.40) + 0.7(2.36 - 0.55)} = 0.26$$

$$b_{III2} = \frac{p_{III2}(\bar{q}_{III2} - r_{III2})}{\sum p_{IIIj}(\bar{q}_{IIIj} - r_{IIIj})} = \frac{0.3(7.28 - 2.40)}{0.5(4.35 - 2.39) + 0.3(7.28 - 2.40) + 0.7(2.36 - 0.55)} = 0.39$$

$$b_{III3} = \frac{p_{III3}(\bar{q}_{III3} - r_{III3})}{\sum p_{IIIj}(\bar{q}_{IIIj} - r_{IIIj})} = \frac{0.7(2.36 - 0.55)}{0.5(4.35 - 2.39) + 0.3(7.28 - 2.40) + 0.7(2.36 - 0.55)} = 0.34$$

2.3 Results of U_{Est}

Using the above estimated values of r_{ij} and b_{ij} , each U_{Est} for C-Sample is finally derived: in Choice I,

$$U_{Est} = 0.32 \ln(q_{I1} - 2.39) + 0.33 \ln(q_{I2} - 2.30) + 0.34 \ln(q_{I3} - 2.50) ;$$

in Choice II,

$$U_{Est} = 0.33 \ln(q_{II1} - 0.96) + 0.41 \ln(q_{II2} - 2.40) + 0.26 \ln(q_{II3} - 2.50) ;$$

in Choice III,

$$U_{Est} = 0.26 \ln(q_{III1} - 2.39) + 0.39 \ln(q_{III2} - 2.40) + 0.34 \ln(q_{III3} - 0.55) .$$

Part 4 Estimating U_{LES} and U_{Est} in Exp. 1 of S-Sample

1 Original data for U_{LES}

Tables 4-1, 4-2, and 4-3 present the original data obtained from Session A in Exp. 1 of S-Sample for solving LES.

Table 4-1-I presents the average values of $p_{I1}q_{I1}$, $p_{I2}q_{I2}$, and $p_{I3}q_{I3}$ of each budget constraint group in Table 4-1; Table 4-2-II the average values of $p_{II1}q_{II1}$, $p_{II2}q_{II2}$, and $p_{II3}q_{II3}$ of each budget constraint group in Table 4-2; and Table 4-3-III the average values of $p_{III1}q_{III1}$, $p_{III2}q_{III2}$, and $p_{III3}q_{III3}$ of each budget constraint group in Table 4-3. U_{LES} will be estimated from Tables 4-1-I, 4-2-II, and 4-3-III.

2 Derivation for U_{LES}

Solving (2-2) in the data of Table 4-1-I for Choice I,

$$\begin{cases} a_{I1}=-0.627, \\ b_{I1}=0.460; \end{cases} \begin{cases} a_{I2}=0.963, \\ b_{I2}=0.130; \end{cases} \begin{cases} a_{I3}=-0.196, \\ b_{I3}=0.375. \end{cases}$$

Solving (2-2) in the data of Table 4-2-II for Choice II,

$$\begin{cases} a_{II1}=-0.131, \\ b_{II1}=0.388; \end{cases} \begin{cases} a_{II2}=0.318, \\ b_{II2}=0.249; \end{cases} \begin{cases} a_{II3}=-0.175, \\ b_{II3}=0.361. \end{cases}$$

Solving (2-2) in the data of Table 4-3-III for Choice III,

$$\begin{cases} a_{III1}=-0.264, \\ b_{III1}=0.408; \end{cases} \begin{cases} a_{III2}=-0.276, \\ b_{III2}=0.376; \end{cases} \begin{cases} a_{III3}=0.586, \\ b_{III3}=0.201. \end{cases}$$

Substitute the above results in (2-4) and solve for r_{ij}

$$\begin{aligned} r_{I1}=2.43, \quad r_{I2}=2.97, \quad r_{I3}=2.61; \\ r_{II1}=3.14, \quad r_{II2}=6.04, \quad r_{II3}=3.98; \\ r_{III1}=1.98, \quad r_{III2}=2.93, \quad r_{III3}=1.72. \end{aligned}$$

Finally obtain each U_{LES} in Session A of Exp. 1 for S-Sample:

in Choice I,

$$U_{LES} = 0.46 \ln(q_{I1} - 2.43) + 0.13 \ln(q_{I2} - 2.97) + 0.38 \ln(q_{I3} - 2.61);$$

in Choice II,

$$U_{LES} = 0.39 \ln(q_{II1} - 3.14) + 0.25 \ln(q_{II2} - 6.04) + 0.6 \ln(q_{II3} - 3.98);$$

in Choice III,

$$U_{LES} = 0.41 \ln(q_{III1} - 1.98) + 0.381 \ln(q_{III2} - 2.93) + 0.20 \ln(q_{III3} - 1.72).$$

3 Derivation for U_{Est}

3.1 Original data for U_{Est}

Tables 4-4, 4-5, 4-6, 4-7, 4-8, and 4-9 present the experimental data obtained from Session B in Exp. 1 of S-Sample.

3.2 Estimating r_{ij}

To estimate r_{ij} , fit the logarithmic law $u_{ij}=c\ln(q_{ij}-r_{ij})+C$, $i=I,II$ and $j=1,2,3$, in the average data of Session B (they are listed on the bottom lines of Tables 4-4, 4-5, 4-6, 4-7, and 4-8. It is realized by the curve regression in SPSS, in which the optimal values of c and C in the logarithmic law are created automatically, but r_{ij} must be selected by hand. To isolate from the derivation of U_{LES} , the procedure for selecting r_{ij} is that select the values of r_{ij} to improve the regression results in SPSS until $R^2 \geq 0.97$.

1) Estimating r_{I1} , r_{I2} , and r_{I3} in Choice I

For Choice I, by fitting the logarithmic law in the average data presented on the bottom lines in Tables 4-4, 4-5, and 4-6, the curve regression results in SPSS are derived as the following:

For the pistachio in Choice I, the logarithmic law is

$$u_{I1}=1.34\ln(q_{I1}-2.21)+0.66, \quad r_{I1}=2.21 \quad (R^2=0.989).$$

Model Summary and Parameter Estimates

Dependent Variable: uI1

Equation	Model Summary					Parameter Estimates	
	R Square	F	df1	df2	Sig.	Constant	b1

Logarithmic	.989	273.753	1	3	.000	.662	1.343
-------------	------	---------	---	---	------	------	-------

The independent variable is q11.

For the almond in Choice I, the logarithmic law is
 $u_{12}=0.91\ln(q_{12}-2.97)+1.38, \quad r_{12}=2.97 \quad (R^2=0.987).$

Model Summary and Parameter Estimates

Dependent Variable:u12

Equation	Model Summary					Parameter Estimates	
	R Square	F	df1	df2	Sig.	Constant	b1
Logarithmic	.987	234.426	1	3	.001	1.376	.907

The independent variable is q12.

For the almond in Choice I, the logarithmic law is
 $u_{13}=1.10\ln(q_{13}-2.61)+1.21, \quad r_{13}=2.61 \quad (R^2=0.991).$

Model Summary and Parameter Estimates

Dependent Variable:u13

Equation	Model Summary					Parameter Estimates	
	R Square	F	df1	df2	Sig.	Constant	b1
Logarithmic	.991	313.249	1	3	.000	1.121	1.096

Summing up, in Choice I, Exp. 1 of S-Sample, the estimated values of r_{Ij} for U_{Est} are $r_{I1}=2.21$, $r_{I2}=2.97$, $r_{I3}=2.61$.

2) Estimating r_{II1} , r_{II2} , and r_{II3} in Choice II

For Choice II, $r_{II3}=r_{I3}=2.61$ because their assigned quantities and prices are the same. By fitting the logarithmic law in the average data presented on the bottom lines in Tables 4-7 and 4-8, the curve regression results in SPSS for r_{II1} and r_{II2} are derived as the following:

For the pistachio in Choice II, the logarithmic law is

$$u_{II1}=1.43\ln(q_{II1}-2.90)+1.69, \quad r_{II1}=2.90 \quad (R^2=0.970).$$

Model Summary and Parameter Estimates

Dependent Variable: uII1

Equation	Model Summary					Parameter Estimates	
	R Square	F	df1	df2	Sig.	Constant	b1
Logarithmic	.970	96.067	1	3	.002	1.688	1.425

The independent variable is qII1.

For the almond in Choice II, the logarithmic law is

$$u_{II2} = 0.63 \ln(q_{II2} - 2.93) + 0.85, \quad r_{II2} = 2.93 \quad (R^2 = 0.975).$$

Model Summary and Parameter Estimates

Dependent Variable: uII2

Equation	Model Summary					Parameter Estimates	
	R Square	F	df1	df2	Sig.	Constant	b1
Logarithmic	.975	117.509	1	3	.002	.853	.630

The independent variable is qII2.

Summing up, in Choice II, Exp. 1 of S-Sample, the estimated values of r_{Ij} for U_{Est} are $r_{I1} = 2.90$, $r_{II2} = 2.93$, $r_{I3} = 2.61$.

3) Estimating r_{III1} , r_{III2} , and r_{III3} in Choice III

For Choice III, $r_{III1} = r_{I1} = 2.21$ and $r_{III2} = r_{II2} = 2.93$ because their assigned quantities and prices are the same respectively. By fitting the logarithmic law in the average data presented on the bottom line in Table 4-9, the curve regression results in SPSS for r_{III3} is derived as the following:

$$u_{III3} = 1.88 \ln(q_{III3} - 1.72) + 0.34, \quad r_{III3} = 1.72 \quad (R^2 = 0.996).$$

Model Summary and Parameter Estimates

Dependent Variable: uIII3

Equation	Model Summary					Parameter Estimates	
	R Square	F	df1	df2	Sig.	Constant	b1
Logarithmic	.996	821.327	1	3	.000	.342	1.876

The independent variable is qIII3.

Summing up, in Choice III of S-Sample, the estimated values of r_{IIIj} for U_{Est} are $r_{III1}=r_{I1}=2.21$, $r_{III2}=r_{I2}=2.93$, $r_{III3}=1.72$.

In summary, the estimated values of r_{ij} for each U_{Est} in Choices I, II, and III of S-Sample all have been obtained. They are collected below:

in Choice I: $r_{I1}=2.21$, $r_{I2}=2.97$, $r_{I3}=2.61$;

in Choice II: $r_{II1}=2.90$, $r_{II2}=2.93$, $r_{II3}=r_{I3}=2.61$;

in Choice III: $r_{III1}=r_{I1}=2.21$, $r_{III2}=r_{II2}=2.93$, $r_{III3}=1.72$.

3.3 Estimating b_{ij}

Using the data on the bottom line of Table 4-1 and the estimated values of r_{Ij} , b_{Ij} for U_{Est} in Choice I, Exp. 1 of S-Sample is estimated

$$b_{I1} = \frac{0.5(4.44 - 2.21)}{0.5(4.44 - 2.21) + 0.5(3.76 - 2.97) + 0.5(4.17 - 2.61)} = 0.49 ;$$

$$b_{I2} = \frac{0.5(3.76 - 2.97)}{0.5(4.44 - 3.07) + 0.5(3.76 - 2.97) + 0.5(4.17 - 2.61)} = 0.17 ;$$

$$b_{I3} = \frac{0.5(4.17 - 2.61)}{0.5(4.44 - 2.21) + 0.5(3.76 - 2.97) + 0.5(4.17 - 2.61)} = 0.34 .$$

Using the data on the bottom line of Table 4-2 and the estimated values of r_{IIj} , b_{IIj} for U_{Est} in Choice II, Exp. 1 of S-Sample is estimated

$$b_{II1} = \frac{0.7(3.13 - 2.90)}{0.7(3.13 - 2.90) + 0.3(6.08 - 2.93) + 0.5(4.10 - 2.61)} = 0.09 ;$$

$$b_{II2} = \frac{0.5(6.08 - 2.93)}{0.7(3.13 - 2.90) + 0.3(6.08 - 2.93) + 0.5(4.10 - 2.61)} = 0.51 ;$$

$$b_{II3} = \frac{0.5(4.10 - 2.61)}{0.7(3.13 - 2.90) + 0.3(6.08 - 2.93) + 0.5(4.10 - 2.61)} = 0.40 .$$

Using the data on the bottom line of Table 4-3 and the estimated values of r_{IIIj} , b_{IIIj} for U_{Est} in Exp. 1 of S-Sample is estimated for Choice III

$$b_{III1} = \frac{0.5(4.44 - 2.21)}{0.5(4.44 - 2.21) + 0.3(6.05 - 2.93) + 0.7(2.56 - 1.72)} = 0.42$$

$$b_{III2} = \frac{0.3(6.05 - 2.93)}{0.5(4.44 - 2.21) + 0.3(6.05 - 2.93) + 0.7(2.56 - 1.72)} = 0.35$$

$$b_{III3} = \frac{0.7(2.56 - 1.72)}{0.5(4.44 - 2.21) + 0.3(6.05 - 2.93) + 0.7(2.56 - 1.72)} = 0.22$$

3.4 Results of U_{Est}

Using the above estimated values of r_{ij} and b_{ij} , each U_{Est} in Exp. 1 for S-Sample is finally derived:
for Choice I,

$$U_{Est} = 0.49 \ln(q_{I1} - 2.21) + 0.17 \ln(q_{I2} - 2.97) + 0.34 \ln(q_{I3} - 2.61);$$

for Choice II,

$$U_{Est} = 0.09 \ln(q_{II1} - 2.90) + 0.51 \ln(q_{II2} - 2.93) + 0.40 \ln(q_{II3} - 2.61);$$

for Choice III,

$$U_{Est} = 0.42 \ln(q_{III1} - 2.21) + 0.35 \ln(q_{III2} - 2.93) + 0.22 \ln(q_{III3} - 1.72).$$

Part 5 Estimating U_{LES} and U_{Est} in Exp. 2 of S-Sample

1 Original data for U_{LES}

Tables 5-1, 5-2, and 5-3 present the original data obtained from Session A in Exp. 2 of S-Sample, and the calculation data $p_{ij}q_{ij}$ and $\Sigma p_{ij}q_{ij}$ for solving LES.

2 Derivation for U_{LES}

Solving (2-2) in the data of Table 5-1-I for Choice I,

$$\begin{cases} a_{I1}=0.568, \\ b_{I1}=0.397; \end{cases} \begin{cases} a_{I2}=-0.684, \\ b_{I2}=0.169; \end{cases} \begin{cases} a_{I3}=-1.250, \\ b_{I3}=0.434. \end{cases}$$

Solving (2-2) in the data of Table 5-2-II for Choice II,

$$\begin{cases} a_{II1}=-0.157, \\ b_{II1}=0.581; \end{cases} \begin{cases} a_{II2}=0.211, \\ b_{II2}=0.181; \end{cases} \begin{cases} a_{II3}=-0.059, \\ b_{II3}=0.240. \end{cases}$$

Solving (2-2) in the data of Table 5-3-III for Choice III,

$$\left\{ \begin{array}{l} a_{III1}=0.181, \\ b_{III1}=0.521; \end{array} \right. \left\{ \begin{array}{l} a_{III2}=0.712, \\ b_{III2}=0.122; \end{array} \right. \left\{ \begin{array}{l} a_{III3}=-0.814, \\ b_{III3}=0.341. \end{array} \right.$$

In Choice I, $1 - \sum_{j=1}^3 b_{Ij} = 1 - (0.397 + 0.169 + 0.434) = 0$, namely, the fraction on the right-hand side of

(2-4) diverges. Choice I in Exp. 2 cannot be tested in this way. Thus, for Exp. 2, only Choices II and III will be tested.

Substitute the above results of Choices II and III in (2-4) and solve for r_{ij}

$$r_{II1}=2.59, \quad r_{II2}=0.74, \quad r_{II3}=0.77;$$

$$r_{III1}=3.91, \quad r_{III2}=1.46, \quad r_{III3}=1.72.$$

Finally obtain each U_{LES} in Choices II and III of Session A, Exp. 2 for S-Sample:

in Choice II,

$$U_{LES} = 0.58 \ln(q_{II1} - 2.59) + 0.18 \ln(q_{II2} - 0.74) + 0.24 \ln(q_{II3} - 0.77);$$

in Choice III,

$$U_{LES} = 0.52 \ln(q_{III1} - 3.91) + 0.12 \ln(q_{III2} - 1.46) + 0.34 \ln(q_{III3} - 1.72).$$

3 Derivation for U_{Est}

3.1 Original data

Tables 5-4, 5-5, 2-6, 5-7, 5-8, and 5-9 present the experimental data obtained from Session B in Exp. 2 of S-Sample.

3.2 Estimating r_{ij}

To estimate r_{ij} , fit the logarithmic law $u_{ij}=c\ln(q_{ij}-r_{ij})+C$, $i=II,III$ and $j=1,2,3$, in the average data of Session B (they are listed on the bottom lines of Tables 5-4, 5-6, 5-7, 5-8, and 5-9. It is realized by the curve regression in SPSS, in which the optimal values of c and C in the logarithmic law are created automatically, but r_{ij} must be selected by hand. To isolate from the derivation of U_{LES} , the procedure for selecting r_{ij} is that select the values of r_{ij} to improve the regression results in SPSS until $R^2 \geq 0.97$.

1) Estimating r_{II1} , r_{II2} , and r_{II3} in Choice II

By fitting the logarithmic law in the average data presented on the bottom lines in Tables 5-4, 5-7, and 5-8, the curve regression results in SPSS for r_{II1} , r_{II2} and r_{II3} are derived as the following:

For the apple in Choice II, the logarithmic law is

$$u_{II1}=1.25\ln(q_{II1}-2.59)+1.19, \quad r_{II1}=2.59 \quad (R^2=0.983).$$

Model Summary and Parameter Estimates

Dependent Variable: uII1

Equation	Model Summary					Parameter Estimates	
	R Square	F	df1	df2	Sig.	Constant	b1
Logarithmic	.983	177.659	1	3	.001	1.191	1.253

The independent variable is qII1.

For the pen in Choice II, the logarithmic law is

$$u_{II2}=2.55\ln(q_{II2}-0.90)-0.44, \quad r_{II2}=0.90 \quad (R^2=0.998).$$

Model Summary and Parameter Estimates

Dependent Variable: uII2

Equation	Model Summary	Parameter Estimates
----------	---------------	---------------------

	R Square	F	df1	df2	Sig.	Constant	b1
Logarithmic	.998	1854.299	1	3	.000	-.438	2.553

For the facial tissue in Choice II, the logarithmic law is
 $u_{113}=2.55\ln(q_{113}-0.77)-0.96, \quad r_{113}=0.77 \quad (R^2=0.990).$

Model Summary and Parameter Estimates

Dependent Variable:u113

Equation	Model Summary					Parameter Estimates	
	R Square	F	df1	df2	Sig.	Constant	b1
Logarithmic	.990	305.313	1	3	.000	-.961	2.554

The independent variable is q113.

Summing up, in Choice II, Exp. 2 of S-Sample, the estimated values of r_{11j} for U_{Est} are $r_{111}=2.59$, $r_{112}=0.90$, $r_{113}=0.77$.

2) Estimating r_{III1} , r_{III2} , and r_{III3} in Choice III

For Choice III, $r_{III2}=r_{III1}=0.90$ because their assigned quantities and prices are the same. By fitting the logarithmic law in the average data presented on the bottom lines in Tables 5-9 and 5-6, the curve regression results in SPSS for r_{III1} and r_{III3} are derived as the following:

For the apple in Choice III, the logarithmic law is

$$u_{III1}=1.06\ln(q_{III1}-3.25)+2.20, \quad r_{III1}=3.25 \quad (R^2=0.970).$$

Model Summary and Parameter Estimates

Dependent Variable: uIII1

Equation	Model Summary					Parameter Estimates	
	R Square	F	df1	df2	Sig.	Constant	b1
Logarithmic	.970	97.578	1	3	.002	2.202	1.059

The independent variable is qIII1.

For the facial tissue in Choice III, the logarithmic law is

$$u_{III3}=1.44\ln(q_{III3}-1.72)+0.37, \quad r_{III3}=1.72 \quad (R^2=0.989).$$

Model Summary and Parameter Estimates

Dependent Variable: uIII3

Equation	Model Summary					Parameter Estimates	
	R Square	F	df1	df2	Sig.	Constant	b1
Logarithmic	.989	262.458	1	3	.001	.373	1.435

The independent variable is qIII3.

Summing up, in Choice III, Exp. 2 of S-Sample, the estimated values of r_{IIIj} for U_{Est} are $r_{III1}=3.25$, $r_{III2}=r_{II2}=0.90$, $r_{III3}=1.72$.

Summing up, the estimated values of r_{ij} for each U_{Est} in Choices I, II, and III of S-Sample all have been obtained. They are collected below:

in Choice II: $r_{II1}=2.59$, $r_{II2}=0.90$, $r_{II3}=0.77$;

in Choice III: $r_{III1}=3.25$, $r_{III2}=r_{II2}=0.90$, $r_{III3}=1.72$.

3.3 Estimating b_{ij}

Using the data on the bottom line of Table 5-2 and the estimated values of r_{IIj} , b_{IIj} for U_{Est} in Choice II, Exp. 2 of S-Sample is estimated

$$b_{II1} = \frac{0.5(8.32 - 2.59)}{0.5(8.32 - 2.59) + 0.9(1.57 - 0.90) + 0.7(2.36 - 0.77)} = 0.63 ;$$

$$b_{II2} = \frac{0.9(1.57 - 0.90)}{0.5(8.32 - 2.59) + 0.9(1.57 - 0.90) + 0.7(2.36 - 0.77)} = 0.13 ;$$

$$b_{II3} = \frac{0.7(2.36 - 0.77)}{0.5(8.32 - 2.59) + 0.9(1.57 - 0.90) + 0.7(2.36 - 0.77)} = 0.24 .$$

Using the data on the bottom line of Table 5-3 and the estimated values of r_{IIIj} , b_{IIIj} for U_{Est} in Exp. 1 of S-Sample is estimated for Choice III

$$b_{III1} = \frac{0.7(5.50 - 3.25)}{0.7(5.50 - 3.25) + 0.9(1.79 - 0.90) + 0.5(3.21 - 1.72)} = 0.50$$

$$b_{III2} = \frac{0.9(1.79 - 0.90)}{0.7(5.50 - 3.25) + 0.9(1.79 - 0.90) + 0.5(3.21 - 1.72)} = 0.26$$

$$b_{III3} = \frac{0.5(3.21 - 1.72)}{0.7(5.50 - 3.25) + 0.9(1.79 - 0.90) + 0.5(3.21 - 1.72)} = 0.24$$

3.4 Results of U_{Est}

Using the above estimated values of r_{ij} and b_{ij} , each U_{Est} in Exp. 1 for S-Sample is finally derived: in Choice II,

$$U_{Est} = 0.63 \ln(q_{I1} - 2.59) + 0.13 \ln(q_{I2} - 0.90) + 0.24 \ln(q_{I3} - 0.77);$$

in Choice III,

$$U_{Est} = 0.50 \ln(q_{II1} - 3.25) + 0.26 \ln(q_{II2} - 0.90) + 0.24 \ln(q_{II3} - 1.72).$$
